### **TiPS Releases LogMate v6.20**

LogMate v6.20 incorporates over 20 years of alarm management knowledge and expertise to offer a market leading alarm management tool. Regardless of the depth of the alarm management initiative being implemented, LogMate's rich feature set provides the necessary tools for a successful campaign. Whether it is an individual "grass roots" or a "full rationalization" project, LogMate's scalability accommodates every project's requirements. Its powerful analysis engine provides users a means to address safety, environmental and financial issues at their facility.

LogMate v6.20 features:

- Real-time alarm and event data collection for all major DCS, HMI and SCADA systems through a variety of methods such as OPC-AE, OLEDB, COM, TCP, SNMP
- Analysis package to identify and reduce nuisance alarms
- Imports configuration data to create a configurable Master Alarm Database
- Real-time updates to Master Alarm Database
- Management of Change compliant with regulatory standards
- Dynamic alarming that provides state-based alarming, simulations and playback process updates, event pattern detection and on-line fault trees
- KPI engine to benchmark and monitor progress
- Thin-client user access – Internet Explorer® is all that is needed on client PCs
- Tight integration with PlantTriage® – loop optimization package

Data in the Master Alarm Database such as Cause, Consequence, Corrective Action and Standard Operating Procedures can be combined with alarm and event data and presented online to operations staff. Combining these two pieces of information allows for even deeper analysis surrounding the alarm system.
